

Lab 6

PHP Form Handling (Cookies and Session)

In this lab, we will cover PHP form handling and see how we can use cookies and sessions to store small amount of temporary information (state information) between browser requests.

Task 1:

This page shows a gallery of food images. The food images are grouped into 3 categories (desserts, Fruits, Healthy). By choosing a category from the drop-down select box and submitting the form, it will show only food images from that category.

Write FoodGalery.html and action.php files.

Victoria's Food Photo Gallery

Click on the submit button to see the corresponding food gallery.

Task 2:

Write a PHP script that can store the visitor's first name and location in two browser cookies, entered via a form, display information from the cookies and delete the cookies when user clicks the "Forget about me" link.

Remembering user information with cookies

Hi, Sara in Lahore!

[Forget about me!](#)

Task 3:

Create a User Login System in PHP using Sessions. (Login with a predefined username and password).

Note:

Make a proper lab report with screenshots (your name should be visible in each screenshot) and upload it in PDF form. Submit the .html and .css files too.

Plagiarism will be marked ZERO for both parties. Copying templates from the internet would also be marked ZERO.
