

# Computer Security

## Lecture 09: Public Key Cryptography

**Prof. Dr. Sadeeq Jan**

Department of Computer Systems Engineering  
University of Engineering and Technology Peshawar

# Lecture Outline

- Public Key Cryptography
- RSA

# Public Key Cryptography

# Private-Key Cryptography

- traditional **private/secret/single key** cryptography uses **one** key
- shared by both sender and receiver
- if this key is disclosed communications are compromised
- also is **symmetric**, parties are equal
- hence does not protect sender from receiver forging a message & claiming is sent by sender

# Public-Key Cryptography

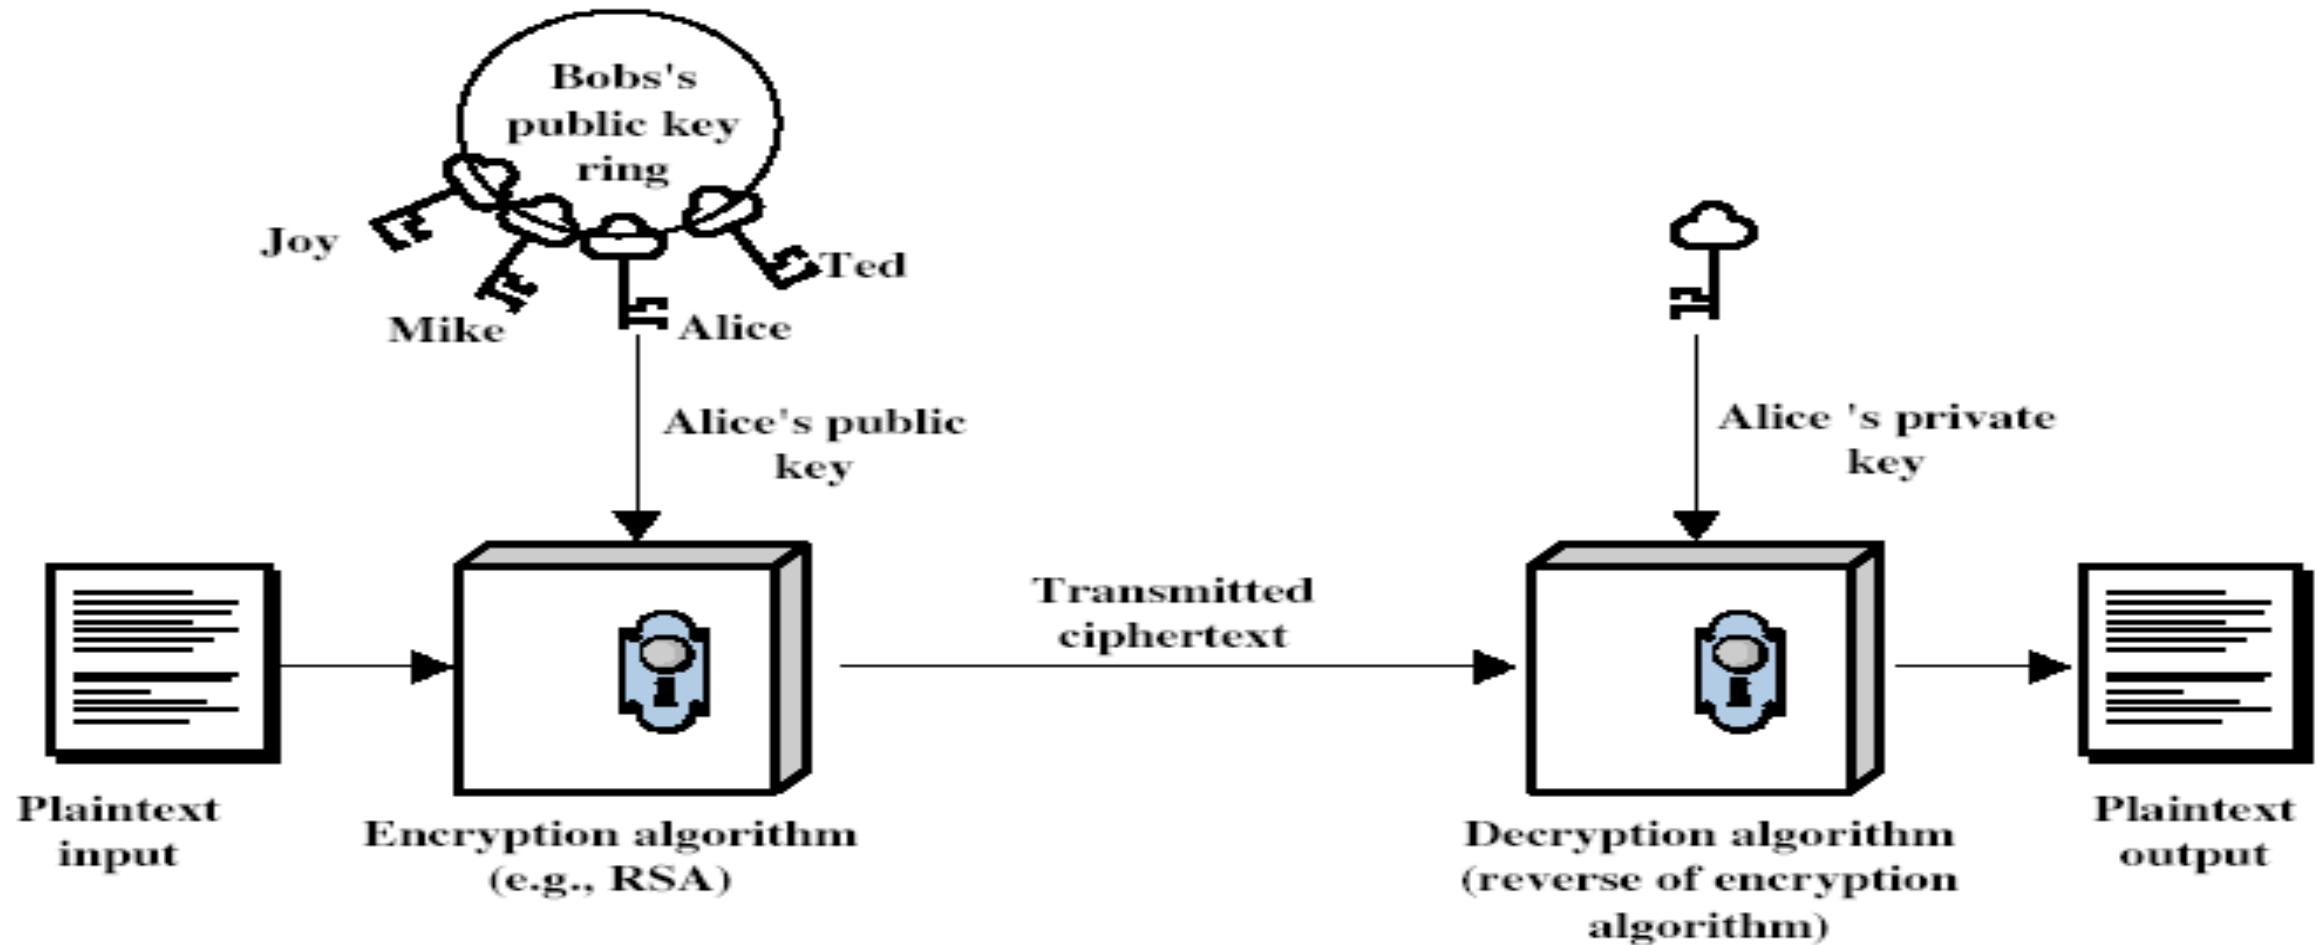

- probably most significant advance in the 3000 year history of cryptography
- uses **two keys** – a public & a private key
- **asymmetric** since parties are **not** equal
- uses clever application of number theoretic concepts to function
- complements **rather than** replaces private key crypto

# Public-Key Cryptography

- **public-key/two-key/asymmetric** cryptography involves the use of **two** keys:
  - a **public-key**, which may be known by anybody, and can be used to **encrypt messages**, and **verify signatures**
  - a **private-key**, known only to the recipient, used to **decrypt messages**, and **sign (create) signatures**
- is **asymmetric** because
  - those who **encrypt messages or verify signatures** **cannot** **decrypt messages or create signatures**

# Public-Key Cryptography

# Why Public-Key Cryptography?

- developed to address two key issues:
  - **key distribution** – how to have secure communications in general without having to trust a KDC with your key
  - **digital signatures** – how to verify a message comes intact from the claimed sender
- public invention due to Whitfield Diffie & Martin Hellman at Stanford Uni in 1976
  - known earlier in classified community

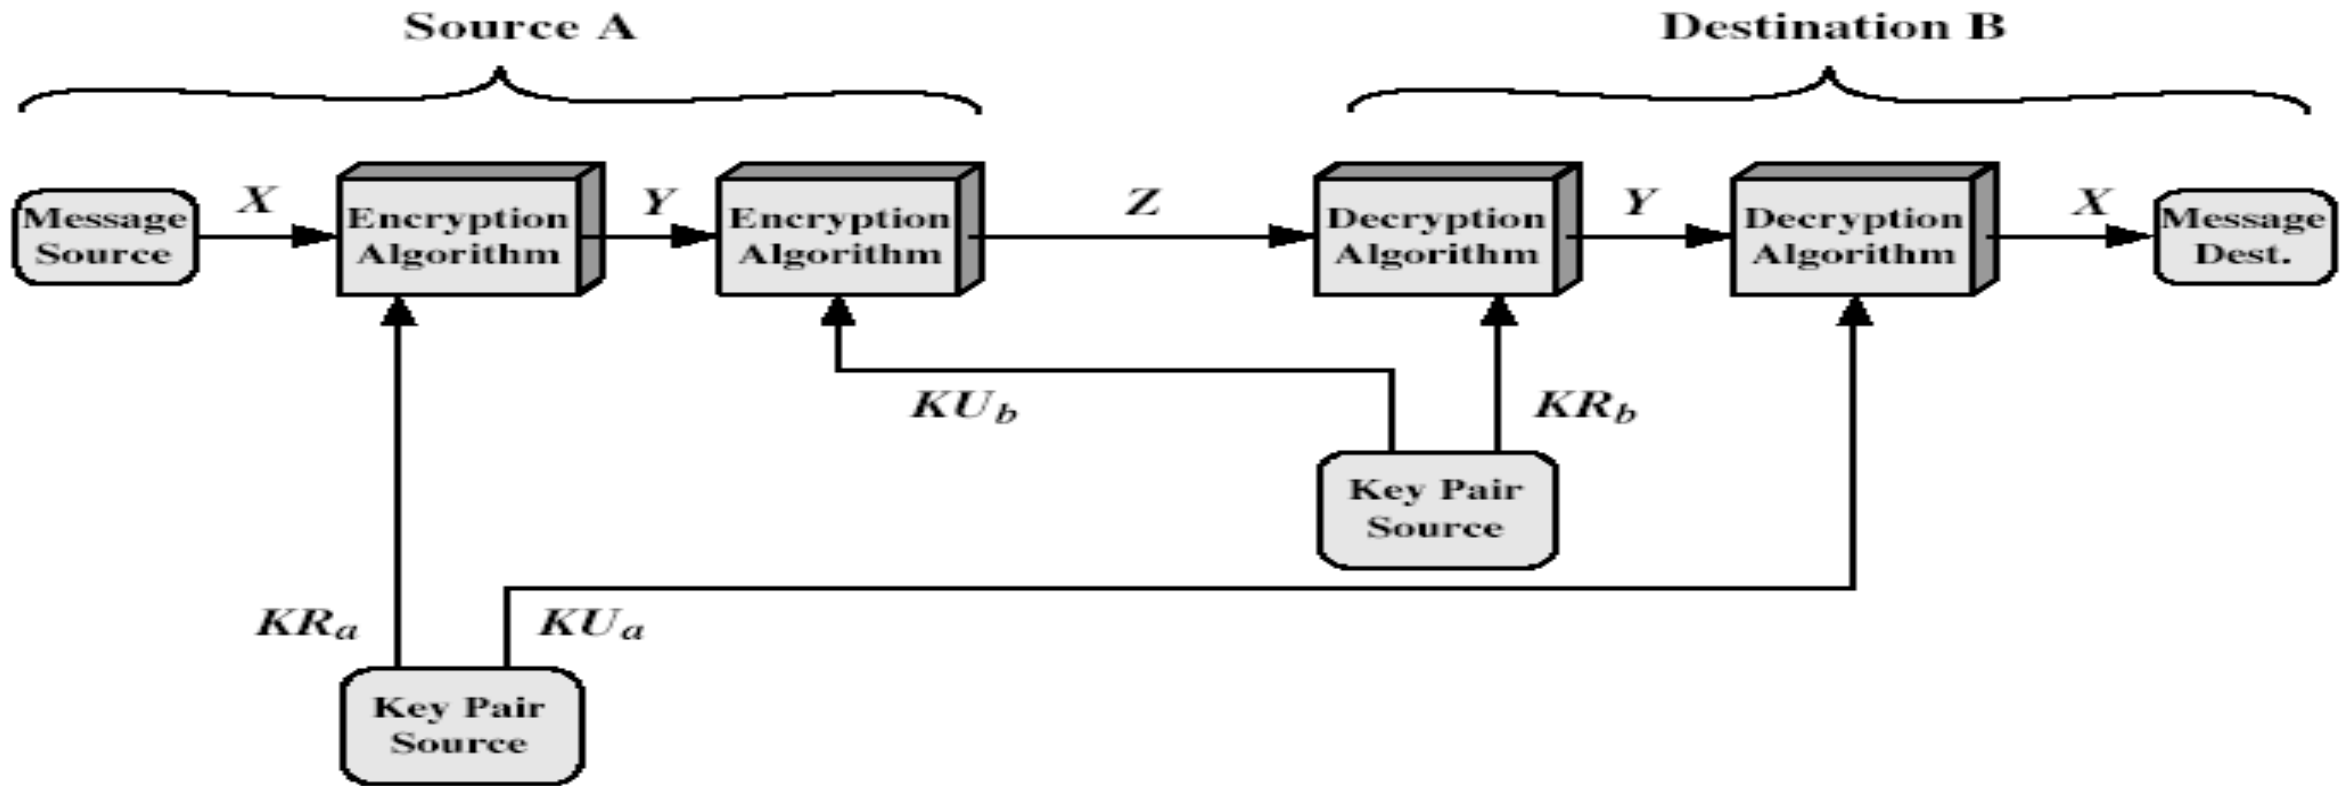

# Public-Key Characteristics

- Public-Key algorithms rely on two keys with the characteristics that it is:
  - computationally infeasible to find decryption key knowing only algorithm & encryption key
  - computationally easy to en/decrypt messages when the relevant (en/decrypt) key is known
  - either of the two related keys can be used for encryption, with the other used for decryption (in some schemes)

# Public-Key Cryptosystems

**Figure 9.4 Public-Key Cryptosystem: Secrecy and Authentication**

# Public-Key Applications

- can classify uses into 3 categories:
  - **encryption/decryption** (provide secrecy)
  - **digital signatures** (provide authentication)
  - **key exchange** (of session keys)
- some algorithms are suitable for all uses, others are specific to one

# Security of Public Key Schemes

- like private key schemes brute force **exhaustive search** attack is always theoretically possible
- but keys used are too large ( $>512$ bits)
- security relies on a **large enough** difference in difficulty between **easy** (en/decrypt) and **hard** (cryptanalyse) problems
- more generally the **hard** problem is known, its just made too hard to do in practise
- requires the use of **very large numbers**
- hence is **slow** compared to private key schemes

# RSA

- by Rivest, Shamir & Adleman of MIT in 1977
- best known & widely used public-key scheme
- based on exponentiation in a finite (Galois) field over integers modulo a prime
- uses large integers (eg. 1024 bits)
- security due to cost of factoring large numbers

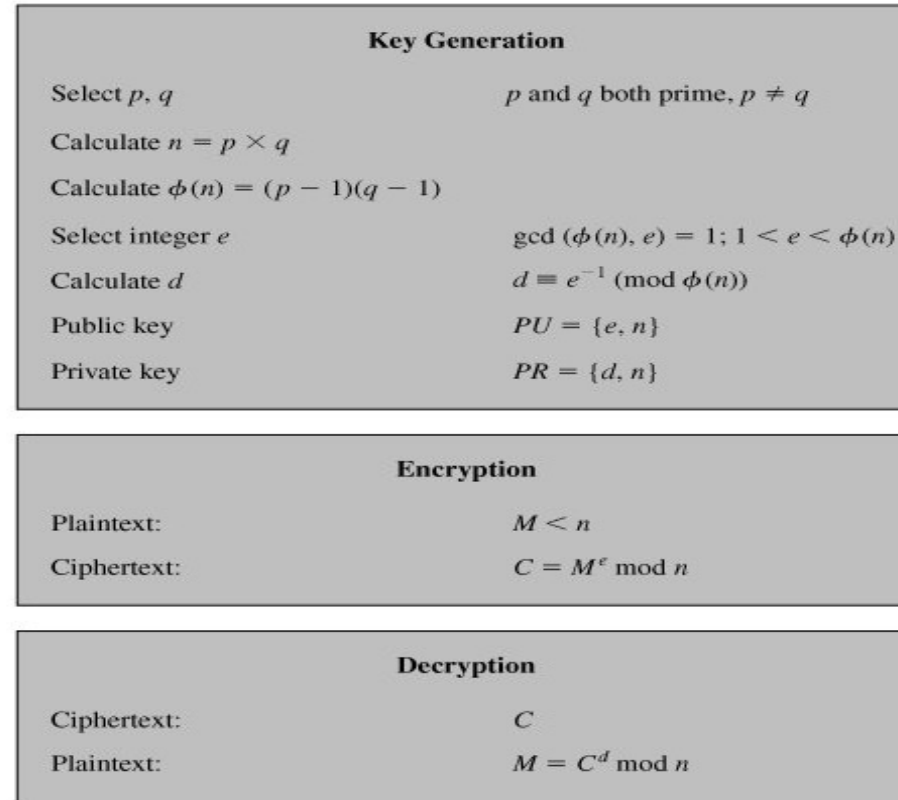

# RSA Key Setup

- each user generates a public/private key pair by:
- selecting two large primes at random -  $p, q$
- computing their system modulus  $N=p.q$ 
  - note  $\phi(N)=(p-1)(q-1)$
- selecting at random the encryption key  $e$ 
  - where  $1 < e < \phi(N)$ ,  $\gcd(e, \phi(N)) = 1$
- solve following equation to find decryption key  $d$ 
  - $e.d = 1 \pmod{\phi(N)}$  and  $0 \leq d \leq N$
- publish their public encryption key:  $KU = \{e, N\}$
- keep secret private decryption key:  $KR = \{d, N\}$

- to encrypt a message  $M$  the sender:
  - obtains **public key** of recipient  $KU=\{e,N\}$
  - computes:  $C=M^e \bmod N$ , where  $0 \leq M < N$
- to decrypt the ciphertext  $C$  the owner:
  - uses their private key  $KR=\{d,p,q\}$
  - computes:  $M=C^d \bmod N$
- note that the message  $M$  must be smaller than the modulus  $N$  (block if needed)
  - $C = M^e \bmod n$
  - $M = C^d \bmod n = (M^e)^d \bmod n = M^{ed} \bmod n$

**Figure 9.6. Example of RSA Algorithm**

# RSA Example

- Select two primes:  $p=17$  &  $q=11$
- Compute  $n = pq = 17 \times 11 = 187$
- Compute  $\phi(n) = (p-1)(q-1) = 16 \times 10 = 160$
- Select  $e$  :  $\gcd(e, 160) = 1$ ; **choose  $e=7$**   
(Select  $e$  such that  $e$  is relatively prime to  $\phi(n) = 160$  and less than  $\phi(n)$  we choose  $e=7$ )
- Determine  $d$ :  $de=1 \pmod{160}$  and  $d < 160$  **Value is  $d=23$  since  $23 \times 7 = 161 = 10 \times 160 + 1$**
- Publish public key  $KU = \{7, 187\}$
- Keep secret private key  $KR = \{23, 187\}$

# RSA Example cont

- sample RSA encryption/decryption is:
- given message  $M = 88$  (nb.  $88 < 187$ )
- encryption:
  - $C = 88^7 \bmod 187 = 11$
- decryption:
  - $M = 11^{23} \bmod 187 = 88$

# Exponentiation

- can use the Square and Multiply Algorithm
- a fast, efficient algorithm for exponentiation
- concept is based on repeatedly squaring base
- and multiplying in the ones that are needed to compute the result
- look at binary representation of exponent
  - eg.  $7^5 = 7^4 \cdot 7^1 = 3 \cdot 7 = 10 \pmod{11}$
  - eg.  $3^{129} = 3^{128} \cdot 3^1 = 5 \cdot 3 = 4 \pmod{11}$

# RSA Key Generation

- users of RSA must:
  - determine two primes at random -  $p, q$
  - select either  $e$  or  $d$  and compute the other
- primes  $p, q$  must not be easily derived from modulus  $N=p.q$ 
  - means must be sufficiently large
- exponents  $e, d$  are inverses, so use Inverse algorithm to compute the other

- Three approaches to attacking RSA:
  - brute force key search (infeasible given size of numbers)
  - mathematical attacks (based on difficulty of computing  $\phi(N)$ , by factoring modulus  $N$ )
  - timing attacks (on running of decryption)

- have considered:
  - principles of public-key cryptography
  - RSA algorithm, implementation, security
